PlantCare AI — Development Prompt

This page is attached after the original PlantCare AI source-code pages. It records the prompt used as the project-generation specification.

Create a responsive college project website named **PlantCare AI**, an AI-powered plant disease detection and plant-care guidance system. Use HTML, CSS, and JavaScript in a single self-contained file. The website should have a clean, modern, agriculture-themed green design and work on both desktop and mobile. Include these sections/pages: 1. **Home** – PlantCare AI title, short description, buttons for “Upload Leaf Image” and “Take Photo”, and feature cards for Easy Detection, AI Analysis, and Simple Solutions. 2. **AI Detection** – Allow the user to upload a JPG/PNG plant leaf image or use the camera. Show a preview of the selected image. Add a “Detect Disease” button. 3. **AI Result** – For the college-project demo, show a sample result of Tomato → Early Blight with 94% AI confidence, Moderate severity, and symptoms. Display the uploaded image in the result. 4. **Solution** – Show five simple steps for managing Tomato Early Blight: remove infected leaves, maintain plant spacing, avoid excess water on leaves, keep the field clean, and use suitable treatment according to agricultural guidance. 5. **Prevention & Plant Care** – Include prevention tips, watering advice, fertilizer advice, and a recommendation to contact an agriculture expert when necessary. 6. **About** – Explain the problem, solution, sample AI results, and future scope. 7. **Dashboard** – Display Total Scans, Healthy Plants, and Diseased Plants. Update the scan count when detection is performed. JavaScript requirements: - Navigation should switch between sections without reloading the page. - Uploading/selecting a leaf image should immediately display a preview. - The camera button should open the image/camera input on supported mobile devices. - If the user presses Detect Disease without selecting an image, show an alert. - For this prototype/demo, detection can use the fixed sample result Tomato → Early Blight with 94% confidence; do not claim that this is a real trained AI model. - Update dashboard counters when a detection is performed. - Keep the code beginner-friendly and easy to understand. Add a clear note that this is a college project/sample guidance system and serious or unfamiliar plant diseases should be confirmed with a qualified agriculture professional. Future scope should mention connecting a real TensorFlow/Keras plant disease model, a backend API, multilingual voice support, and crop-specific recommendations. Make the final UI professional, simple, responsive, and suitable for a college AI Immersion project presentation.

Important implementation note

The attached project code currently demonstrates AI detection using a fixed sample result. The actual trained AI/TensorFlow-Keras integration is listed as future scope.
